Setu’s approach to Business Process Re-engineering for public sector digital transformation

From policy and funding intent to implementable services

Setu Advisory

Effective BPR ensures digital transformation improves outcomes

Business Process Re-engineering (BPR) is the **systematic redesign of an organization's processes** to deliver better outcomes for users and the organization. For governments undertaking digitalization, **effective BPR can improve the value, accessibility and efficiency of public services,** supporting more effective delivery against policy objectives, not just digitizing broken processes

Why should public sector organisations include BPR in their digital transformation journey?

Build ownership & governance – BPR co-design brings stakeholders into the redesign process while establishing governance needed to make decisions and build ownership

Improve efficiency & user value – challenging current processes exposes duplication, unnecessary steps and opportunities to improve outcomes for citizens, businesses and government

Resolve choices cheaply and early – BPR surfaces policy, operational and institutional trade-offs before they become embedded in technology, reducing costly rework later

Setu Advisory

BPR translates policy intent into deliverable digital services

BPR is the translation layer between strategy and delivery

1

What BPR needs from policy and strategy:

- Clear policy objectives and intended outcomes
- Relevant policy / legal constraints
- Decision-makers with authority to resolve trade-offs

2

What BPR produces

- Service journeys and end-to-end processes
- Roles and responsibilities at organization & team level
- Business requirements: governance, organizational & performance
- Technology requirements: functional & data

3

What BPR enables

- **For build/procurement:** clear business and functional requirements against which technology solutions can be designed and procured
- **For implementation:** agreed processes, roles, governance and change requirements to enable adoption
- **For measurement:** defined outcomes and performance measures against which the new services can be assessed

Transformation stack

Policy intent
What changes does the government with to achieve for the country?

Strategic objectives
How can each organization support delivery of these changes?

Business process re-engineering
Redesign services and processes into delivery-ready requirements

Build / procure
Design, buy or configure technology and supplier capability.

Implement
Adopt new processes, roles, governance and ways of working.

Measure and improve
Track outcomes and refine the redesigned service

Setu Advisory

Setu delivers BPR through a structured five-stage methodology

Business Process re-engineering takes place over **five distinct steps**, with **stakeholder collaboration running alongside them**:

Approach

1. Scope & Align

Key activities:
- Define Objectives, Key Results and design principles
- Define stakeholders and governance model
- Confirm workplan, resources, plan, risks & mitigations

2. Understand & diagnose current state

Key activities:
- Map end-to-end processes
- Identify actors, rules, policies, data and systems
- Determine pain points and root causes
- Test & prioritise pain points

3. Future State Design

Key activities:
- Redesign processes, removing duplication
- Identify opportunities for digital enablement
- Assess policy, people, data & technology implications

4. Requirements definition

Key activities:
- Translate processes into business & functional requirements
- Define business rules, system integration requirements
- Validate and prioritise

5. Prepare for Implementation

Key activities:
- Identify implementation activities and dependencies
- Prioritise quick wins vs foundational changes
- Identify risks and mitigations
- Define benefits measures

Key governance question:

- Are the right people agreed on what we're trying to do?
- Do we agree on the size and shape of the problems?
- Do the right people agree this is the process we want?
- Are these requirements clear enough to proceed to build/buy?
- Is the path to implementation credible?

6. Collaborative co-design, capability transfer and knowledge sharing

Tried, tested, iterative, collaborative and tightly governed - why this approach works:

- ✓ **Structured evidence** enables faster, better decisions
- ✓ **Issues surfaced early,** before expensive digital systems are built
- ✓ **Stakeholders shape the solution**, increasing adoption
- ✓ **Cross-institutional alignment** is created by shared evidence base
